## Overview

---

The Overview section contains two matrices that provide summary counts, by severity, using VPR or CVSS. Within each cell there is a number for the vulnerability count, and in parentheses the count of exploitable vulnerabilities. Also provided is the count based on severity level.

---

## Vulnerability Instances: all and exploitable, by severity

VPR: all(exploitable)

CVSS v3.0: all(exploitable)

## **Top 10 Critical Vulnerabilities**

---

The two tables in this chapter provide a top 10 vulnerabilities grouped using the critical VPR or critical CVSS. For VPR and CVSS v3.0 the rating is 9.0 - 10, for CVSS v2.0 the rating is 10. The vulnerabilities identified using VPR are the most active in the wild, and based on an in-depth threat analysis, are considered the most critical to mitigate. Traditionally, the method for identifying risk was most commonly with CVSS v3.0 or CVSS v2.0. While each still remain very important, and should be mitigated, these vulnerabilities are not given the same context as VPR identified vulnerabilities.

## Top 10 High Vulnerabilities

---

The two tables in this chapter provide a top ' + limit + ' vulnerabilities grouped using the High VPR or High CVSS. For VPR and CVSS v3.0 the rating is 7.0 - 8.9, for CVSS v2.0 the rating is 7.0 - 9.9. The vulnerabilities identified using VPR are the most active in the wild and based on an in-depth threat analysis are considered the most critical to mitigate. Traditionally, the method for identifying risk was most commonly with CVSS v3.0 or CVSS v2.0. While each still remain very important, and should be mitigated, these vulnerabilities are not given the same context as VPR identified vulnerabilities.

## **Top 10 Most Prevalent Vulnerabilities**

---

The two tables in this chapter provide a top 10 vulnerabilities grouped using the Medium through Critical. For VPR, CVSS v3.0, and CVSS v2.0 the rating is 4.0 - 10. The vulnerabilities identified using VPR are the most active in the wild and based on an in-depth threat analysis are considered the most critical to mitigate. Traditionally, the method for identifying risk was most commonly with CVSS v3.0 or CVSS v2.0. While each still remain very important, and should be mitigated, these vulnerabilities are not given the same context as VPR identified vulnerabilities.

## **OS Detections Report**

---

System administrators and the security team work together to identify systems at the most risk. A good first step is to understand the operating systems in the network. This report provides a summary of the most prevalent operating systems on the network.

---

## OS Detections: Counts by Confidence Level

Nessus leverages several attributes such as "operating-system", "operating-system-unsupported", "os" and "operating-system-conf" to group the hosts into different OS families. In doing so this report organizes the system counts first using a matrix style table, that displays rows by the confidence level and then by an OS family using columns. The All column displays the total count of plugin present at the respective Confidence Level. The Windows, MacOS, and Linux, columns filter based on the key words "windows", "mac", or "linux". The Other column will match on anything that does match the aforementioned key words.

| Confidence | All | Windows | MacOS | Linux | Other |
|------------|-----|---------|-------|-------|-------|
| 0 - 9      | 0   | 0       | 0     | 0     | 0     |
| 10 - 19    | 0   | 0       | 0     | 0     | 0     |
| 20 - 29    | 0   | 0       | 0     | 0     | 0     |
| 30 - 39    | 0   | 0       | 0     | 0     | 0     |
| 40 - 49    | 0   | 0       | 0     | 0     | 0     |
| 50 - 59    | 1   | 0       | 0     | 1     | 0     |
| 60 - 69    | 3   | 0       | 0     | 3     | 0     |
| 70 - 79    | 4   | 1       | 0     | 1     | 2     |
| 80 - 89    | 0   | 0       | 0     | 0     | 0     |
| 90 - 100   | 7   | 0       | 1     | 2     | 4     |
| Totals     | 15  | 1       | 1     | 7     | 6     |

## OS Detections: Max Severity by OS Family (Confidence > 50)

Building upon the previous matrix, the OS Detections: Max Severity by OS Family (Confidence > 50) table provides the security team with summary view of risk based on operating system. The counts represented in this table are based on system count by OS family and if a vulnerability with the indicated severity is present. For example, in the Windows column and the High severity row, say there is a number 15. The number represents that there are 15 assets identified to have a Windows operating system with at least 1 high severity vulnerability.

| Severity (CVSS v3.0) | All | Windows | MacOS | Linux | Other |
|----------------------|-----|---------|-------|-------|-------|
| CRITICAL             | 2   | 0       | 0     | 1     | 1     |
| HIGH                 | 2   | 0       | 0     | 2     | 0     |
| MEDIUM               | 5   | 0       | 0     | 4     | 1     |
| LOW                  | 0   | 0       | 0     | 0     | 0     |
| INFO                 | 6   | 1       | 1     | 0     | 4     |
| Totals               | 15  | 1       | 1     | 7     | 6     |

## OS Detections: Details (Confidence > 50)

The OS Detections: Details (Confidence > 50) table presents all of the OS family detections, along with assets within each OS. The table also displays if the OS is supported by the vendor.

## **Unsupported Software Report**

---

The proliferation of unsupported and end-of-life (EOL) software is an issue for many organizations and increases the effort required to minimize risk. As software reaches end-of-life, vendors often stop providing updates and support for the older versions. This report provides system administrators with a summary of the software that is no longer supported and puts the organization at the most risk.

## **Default/Known Accounts Report**

---

Default and/or known accounts create an easy entry point for attackers to take advantage of to gain access to the network and hosts. Once inside the network, an attacker can perform malicious attacks, steal sensitive data, and cause significant damage to critical systems. This report provides a summary of the most prevalent detections of default and known accounts.

---

## Default/Known Accounts: Top 25

The Default/Known Accounts: Top 25 table uses the a list of plugins that are known to detect default and known accounts. The data is then sorted using the count, which is a representation of the affected hosts. While some plugins may be present more than one time on a single host, for the most part a plugin will only be present once on each host. This list of vulnerabilities exposes the organization to many different attack frameworks and script kiddie attacks. These vulnerabilities should be prioritized and the software removed or updated to a supported version as soon as possible.

| Severity (CVSS v3.0) | Plugin ID | Plugin Name                 | Count |
|----------------------|-----------|-----------------------------|-------|
| INFO                 | 95928     | Linux User List Enumeration | 1     |

## Default/Known Accounts: Hosts by Plugin

The Default/Known Accounts: Hosts by Plugin table provides the IT operations team with an action plan and the identified hosts for each vulnerability. IT managers are able to use this information in planning patch deployments and in working with the information security team in risk mitigation efforts. The table also uses a known list of plugins that identify entities that are using default and/or known accounts and then sorts the scan results using severity, then plugin ID. The entries in the "Hosts" column are then sorted in ascending order.

| Severity (CVSS v3.0) | Plugin ID | Plugin Name                 | Hosts           |
|----------------------|-----------|-----------------------------|-----------------|
